Detailed solutions to algebra problems are presented. Solution to Problem 1: Given the equation.  $5(-3x-2)-(x-3)=-4(4x+5)+13$ . Multiply factors.  $-15x-10-x+3=-16x-20+13$ . Group like terms.  $-16x-7=-16x-7$ . Add  $16x+7$  to both sides and write the equation as follows.

Also, you might have noticed that  $(x = 3)$  is not the only solution to  $(x^2 - 9 = 0)$ . In this case  $(x = -3)$  is also a solution. We call the complete set of all solutions the solution set for the equation or inequality. There is also some formal notation for solution sets although we won't be using it all that often in this course.

We are to find and . We can solve this through the substitution method. First, substitute the second equation into the first equation to get. Solve for  $y$  by adding  $4x$  to both sides. Add  $5$  to both sides. Divide by  $7$ . So . Use this value to find using one of the equations from our given system of equations. I think I'll use the first equation (can also use the second equation).
