to start troubleshooting the VFD is by doing a thorough visual inspection. Clean up dirt, dust and corrosion build up on the heatsink of the drive. Then check all wiring connections for tightness. Loose connections in the wiring of the drive to the incoming power and to the motor are a major cause of drive failure.

Troubleshooting Possible causes: #1 - - Dirty Filters or VFD heatsink. VFD cooling fans not working. Enclosure stirring fans not working. Enclosure cooling fan filters are clogged. Ambient temperature is above the rating of the VFD. Top Vents. Do not use compressed air to blow out the VFD.

How do you find and resolve the problem quickly? When that variable frequency drive (VFD) goes down, you're under pressure to get it back online. Don't let this pressure make you take even longer to resolve the problem. Instead, remember the VFD troubleshooting checkpoints: check the basics (the controller display, connections, and temperatures),

f_0 = Maximum variable frequency drive output frequency
If $2L_{min} < L_{max}$ then any value between these limits can be used. If $2L_{min} > L_{max}$ then the variable frequency drive cannot operate with this length of cable and a higher rated variable frequency drive must be used. Consideration must be given to the high frequency losses in the chokes.

Using the Inputs on a Variable Frequency Drive. There are many ways to control a variable frequency drive, but often the analogue and digital inputs are used. These can be programmed in many different ways. On Invertek's E3 drive parameters P-15 and P-12 can be used to select favourite settings for the two digital and two analogue or digital ...
